CyberPatriot Ubuntu Documentation

- Unlike Windows, macOS, iOS, and Android, almost everything is done through the terminal in Linux due to it mostly being used in servers which need maximum resources going to the application rather than a pretty interface.
- To copy and paste something into the terminal, press "**ctrl + c**" to copy and "**right mouse click**" and then go to the paste option in the terminal. Please note that (**control + v**) doesn't work in the terminal.
- Terminal can be accessed by pressing the Windows key and typing in "terminal" or the shortcut of pressing "**control + alt + t**" will also bring up the terminal.
- Pressing "**control + alt + f12**" will bring up the terminal ONLY interface. To go back to the GUI (Graphical User Interface), press "**control + alt + f1**"
- Ubuntu is based on Debian, this means it is a modified version of Debian.
- Ubuntu's default desktop environment (Home Screen/Launcher) is called gnomes.

GUI Tutorial

- Check the users on the website and compare them with the ones on the computer. If there is a user that is on the computer **BUT** not on the website, delete that user.

Install Anti-Virus and remove hacking tools

- Install AV: sudo apt install clamav
- Remove ALL hacking tools and malware: 1) sudo freshclam 2) clamscan -r --recursive --remove --max-filesize=2G /

Bash Script Tutorial (The Linux Way)

1) To make a script the Linux way: open a terminal window (found in applications).
2) Type "nano my_first_script.sh" followed by enter.
3) Enter the bash commands you want on each new line, ie- Line 1: sudo freshclam Line 2: clamscan -r --recursive --remove /
4) To save and exit it, enter control + x > y > enter.
5) To make it executable: "chmod +x my_first_script.sh"
6) To run it: "./my_first_script.sh"
7) If it asks for a sudo password, type in the password for the root user (default user in CyberPatriot).

Installing Software In Ubuntu

- To enable the firewall on Ubuntu, enter the following command into terminal:

1) **“sudo ufw enable”**

- To Install the firewall GUI on Ubuntu, enter the following command into terminal:

1) **“sudo apt install gufw”**

- To install anti-malware/anti-virus software in Ubuntu enter the following command into terminal (ClamTK):

1) **“sudo apt install clamav clamtk”**

- To update Ubuntu enter the following commands into terminal:

1) **“sudo apt update”**
2) **“sudo apt upgrade”**
3) **“sudo apt autoremove”**
4) **“sudo apt autoclean”**

Useful Terminal Commands

- To list all files and directories:

1) **“Ls -la”**

- To navigate to a directory:

1) **“cd <name of directory>”**

- To use a space:

1) **“\ ”**

- To go back to the previous directory:

1) **“cd -”**

- To clear the terminal window:

1) **“clear”**

- To see all files installed on the system user:

1) **“dpkg --list”**

- To uninstall a program:

1) **“sudo apt purge <package-name>”**

- To run the terminal command as root (NEVER run the user as root as this is a very big security vulnerability unless otherwise stated):

1) **“sudo <command>”**

- To remove root locked files:

1) **“cd <directory where root file is>”**
2) **“sudo rm <file name>”**

- To remove root locked directory:

1) **“cd <directory where root file is>”**
2) **“sudo rm -r <directory name>”**

- To check firewall status:

1) **“sudo ufw status”**

- To parse text output of a command:

1) **“<command> | grep <query>”**

- To list contents of a file:

1) **“cat <my_file.txt>”**

- To add command together:

1) **“<command 1> && <command 2>”**
